I have checked online and it seems that for months the KTS has been sold with a cracked esi. What is the most recent version of the esi firmware on the KTS? How can i find this out? A: It seems that this question is related to the ESXi 6.5.0-20171026001. Find Your ESXi Image Version A known type of reverse flow temperature detector typically includes a thermistor or thermocouple assembly encased within a tubular body of thermally conductive material, which thermally conducts heat from a region of high temperature to a region of lower temperature. The thermistor or thermocouple assembly senses the temperature of the region of higher temperature, and causes an electrical pulse to be emitted to a detector circuit when the sensed temperature is above a preset threshold level. If the region of higher temperature is a molten metal, such as steel in a blast furnace, for example, the thermistor or thermocouple assembly comprises an elongate sensor of the type that is referred to

in the art as a temperature sensing wire or T-wire. The thermistor or thermocouple assembly is located within the tubular body, and a collar is crimped around the open end of the tubular body to form an end cap, which is crimped to a flange of the tubular body, to enclose the end of the tubular body. The elongate sensor extends through the end cap, from the interior of the tubular body to the exterior of the tubular body, and is located within the tubular body. The thermistor or thermocouple assembly is typically protected against the ingress of atmosphere by a cover comprising a porous ceramic material, and the porous ceramic material is attached to the end cap by a layer of glass. The glass layer is typically formed by fusing the glass on the end cap by means of a frit. The ceramic cover protects the end cap and its surroundings from high temperature, e.g., 1000° C. to 2000° C., and high ambient temperature, e.g., 100° C., and also protects the sensor from erosion by the molten metal. The ceramic cover also inhibits the ingress of oxygen into the end cap, thereby inhibiting the oxidation of the temperature sensing element in the end cap. A temperature detector of this type is used, in one example of its application, in a blast furnace to detect the presence of molten steel in a converter, which is 82157476af
